

Science of Food Educator Event

June 12, 2024

Everyone - Please sign in via the link in the chat

Illinois Educators - must sign in and sign out at additional link to receive ISBE credit

While we're waiting to begin, **introduce yourself in the chat!**

- **Your name**
- **State of residence**
- **Grade/Subject taught**
- **Share an unusual food pairing that you love**

Welcome and Agenda

Agenda Item	Time Estimates
Welcome, Sign In, Introductions and Industry Overview (Christina & Katie)	15 minutes (9:00-9:15)
Session 1: Intro to Food Science (Tamieka)	40 minutes (9:15-9:55)
Break – gather ingredients	5 minutes (9:55-10:00)
Session 2: Food Science Experiments (Tamieka)	45 minutes (10:00-10:45)
Session 3: Careers in Food Science & Next Steps for your Students (Linda, Amy & Katie)	45 minutes (10:45-11:30)
Closing Reminders (Christina)	

Objectives and Goals

- **Increase awareness that food science is a part of everything we eat/drink.**
 - Develop an appreciation for using food science examples to help teach scientific concepts in your current curriculum.
- **Understand the pressures and demands on the food industry, to safely feed the billions of people on our planet.**
 - Experience the magnitude of the food industry and all the companies that support it.
- **Attract curious and innovative minds.**
 - Encourage students that are passionate about science & problem solving, to consider a **career** in the food industry. **YOU** are the biggest influence in getting students interested in food science.

Feeding the minds that feed the world

Envision what the very best minds involved in the science of food can achieve when they work together: providing each and every person on the planet with a safe, nutritious, and sustainable food supply.

We award. We educate. We research. We innovate. We share.

Feeding Tomorrow Fund aims to ensure the vital work of food scientists continues and carries over to the next generation.

Chicagoland
Food Science
Foundation

Chicagoland Food Science Foundation

Develop, promote and support food/beverage industry professionals through awareness and scholarship programs.

Flavor Company

McCormick Flavor Solutions creates flavors for some of the worlds most beloved foods, snacks and beverages! Science & creativity are key to allowing us to please consumer palates across the world.

Pilot Light

Pilot Light is a teacher-centered Food Education nonprofit that develops programming and educator capacity for the food system leaders of the future through engaging and relevant classroom learning.

Wang**

What is the food industry?

Katie Sudler – Food Ingredients (Flavors)

- 23+ years in the Flavor Industry, supporting Food & Beverage Companies
- **Current Role:** **McCormick & Company, Flavor Division** - Responsible for partnerships in the communities we manufacture and in food/beverage industry, to build good name and reputation in both.
- **Past Roles:** Food Regulations and Marketing
- **Brands:** Have worked with 100's of companies to ideate and create products across Beverage, Alcohol, Confection, Dairy and Bakery segments.
- **Education:**
 - B.S. in Dietetics - Purdue University
 - Business classes - Northern Illinois University
 - M.S. in Child, Youth & Family Studies – University of Nebraska-Lincoln
 - IL Teaching Certificate - grades 6-12 to teach Health & Family and Consumer Sciences
- **Favorite Subject in High School:** Physics, Environmental Science, Trigonometry

Meet the food we eat.

The eating & drinking experience.

Your genetic make-up

- Dictate preferences
- Dislikes
- May alter how you experience something (Cilantro)

Taste:

- Sweet
- Sour
- Salty
- Bitter
- Umami

Hearing:

- Crunch
- Carbonation
- Popping

Touch:

- Temperature
- Texture
- Carbonation

Sight:

- Does your food look like it should?

Smell:

- Characterizes food/beverages

How do you 'taste' your food?

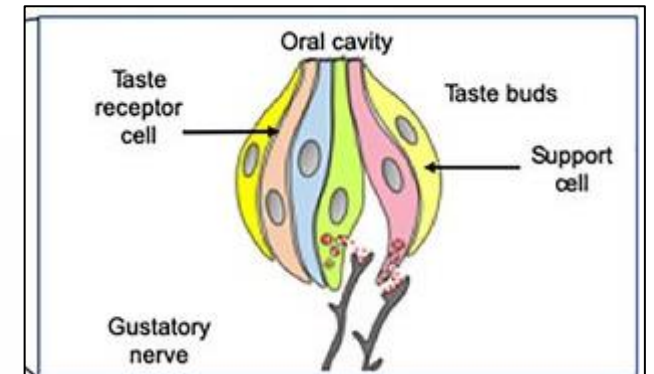

1. Grab a piece of candy.
2. Unwrap it.
3. Plug your nose.
4. Put candy in mouth. Plug it tight!
5. What do you taste?
6. Let's talk about how we taste.

Index:

- Orthonasal
- ▼ Retronasal

Taste buds

Food Science & your students

- Your students need to understand how science, technology & society are interrelated.
- Challenge our students to build on what they already know– connecting what is learned in a science class & their lives in the world.
- Take the concerns, interests & experiences of students and connect them to the classroom, using scientific knowledge & critical thinking.

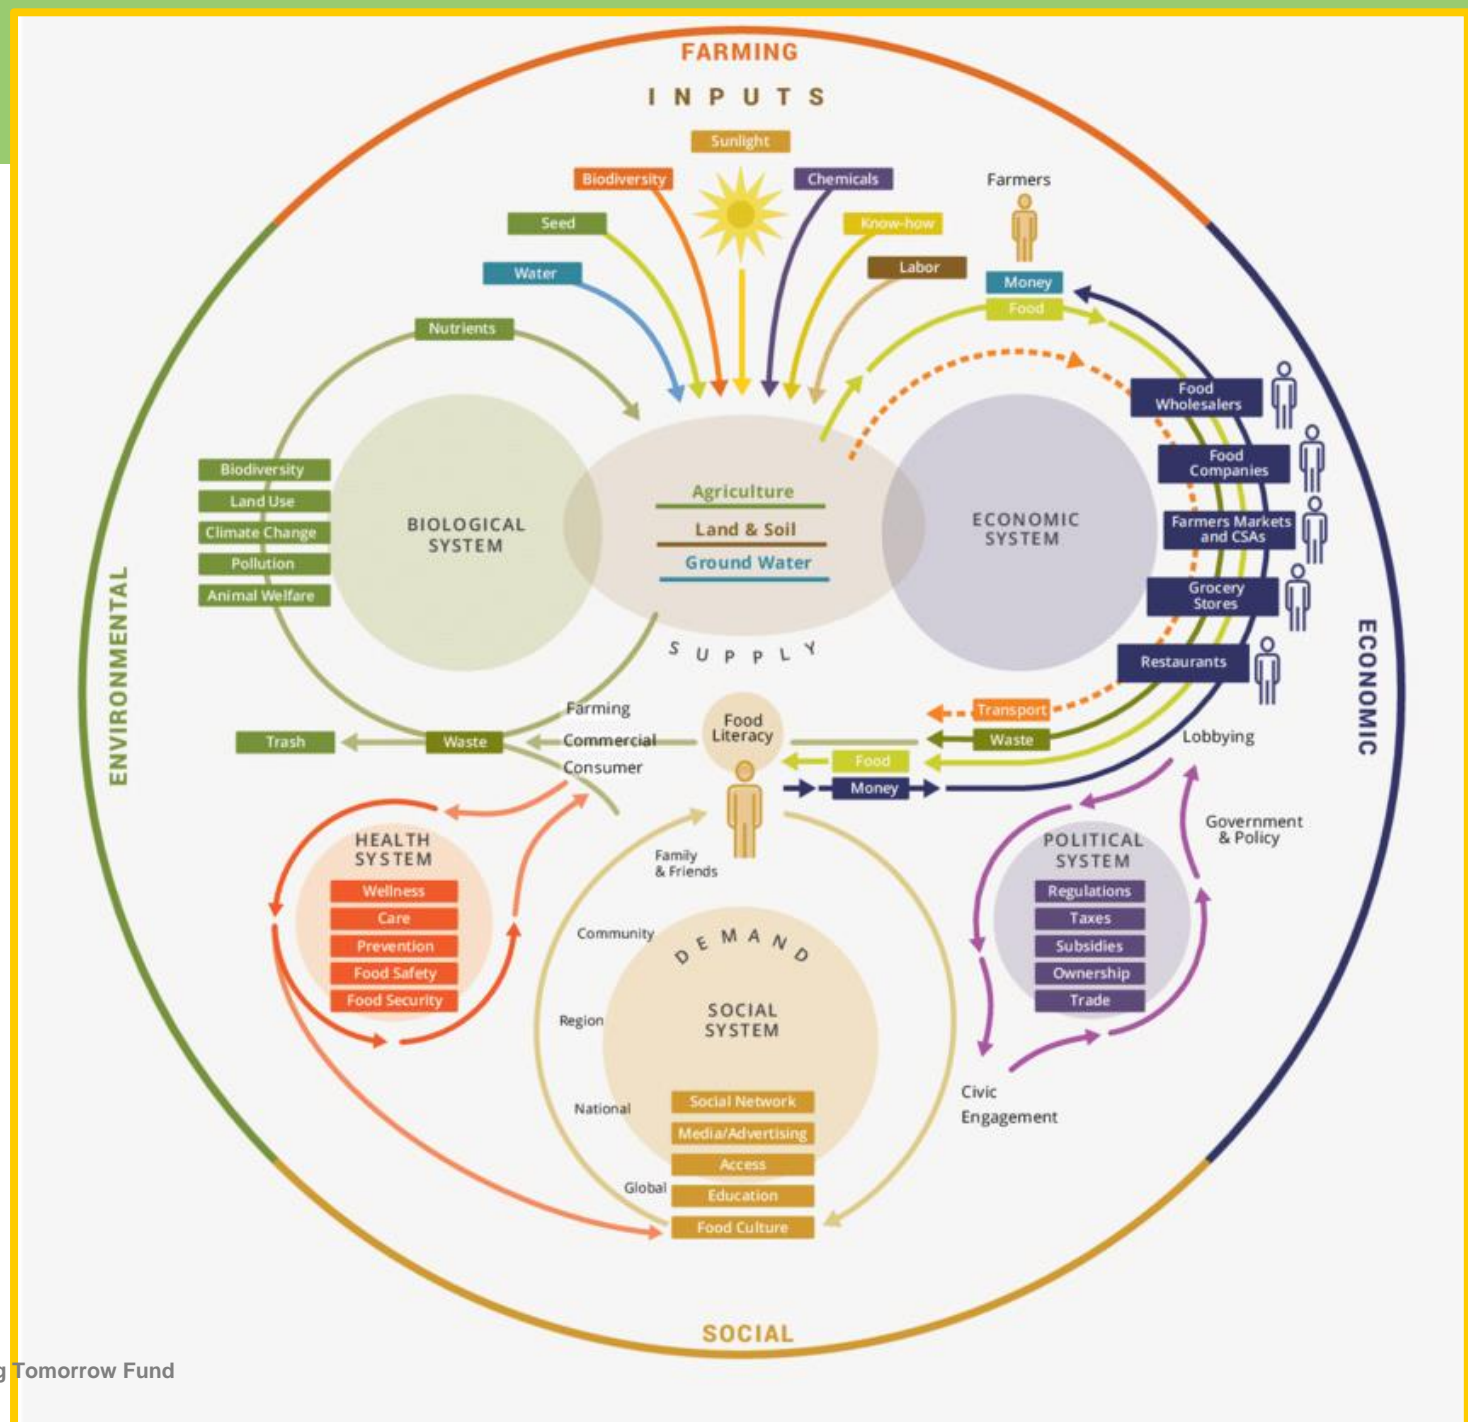

Food System

Food System

- “We live in a world where everything is connected. We can not longer think in terms of us and them when it comes to the consequences of the way we live. Today it's all about WE.”
- Gregg Bradden, Author, The Turning Point

Food Industry Facts

- Dollar Size of food and beverage industry is difficult to navigate.
- Global food industry experiences appx. 3% growth
- Major Metro Areas are strong in food manufacturing.
- Thousands of companies make up the industry, all various sizes.

Nation's capital of food & beverage industry is Chicagoland

- Approximately 4,500 firms make up the cluster
- 130,000 employees
- \$32 billion in sales.

***Encompasses any consumable/ingestible product that is either produced or uses products from companies to manufactured finished, marketed and sellable product.*

What is the food industry?

Top Food/Beverage Companies - USA

1. Nestle 
2. PepsiCo, Inc 
3. Anheuser – Busch InBev 
4. JBS 
5. Tyson Foods 
6. Archer Daniels Midland Company (ADM) 
7. Mars 
8. Cargill 
9. The Coca-Cola Company 
10. Kraft Heinz Company 

Brands you may not know they own:

1. Gerber, Purina Pet, Häagen-Dazs, Essentia Water, Vital Proteins
2. Quaker, Pepsi, Aquafina, Frito Lay, Doritos
3. Goose Island, Corona, Kona, Modelo, Stella
4. Largest animal protein processor in the world
5. Sara Lee, Bosco's, Jimmy Dean
6. Food ingredients (ancient grains, colors, flours, sweeteners, nuts, proteins, more)
7. Wrigley, Seeds of Change, Skittles, Kind, Banfield Pet, Royal Canin
8. Food ingredients (cocoa, oils, flour, hydrocolloids, starches, more)
9. Honest, Vitamin Water, Powerade, Topo Chico, Gold Peak tea, Aha
10. Oscar Meyer, Capri Sun, Philadelphia, Planters, Ore-Ida, Maxwell House

What is the food industry?

Food brings people together.

Food science brings the food system together.

Session 1: What is Food Science?

Tamieka Hardy

Tamieka Hardy, MAS, PCQI, is the [Fellowship](#) Alumni Network (FAN) Manager at [Pilot Light](#). She holds degrees in Culinary Arts, Culinology®, Food Science and Nutrition, and Food Safety and Technology.

With a background as a food scientist and research chef, Tamieka holds considerable expertise in food safety and technology. She is the CEO of Croissant Sol, LLC, a consultancy that offers product development services and food safety education.

Tamieka is also a food industry writer, with articles published in Prepared Foods Magazine and the Journal of Renal Nutrition. In her role at Pilot Light, she manages the Fellowship Alumni Network, supporting food educators and professionals.

Tamieka's diverse experience in culinary arts, food science, and safety enables her to contribute effectively to various initiatives, promoting better food education and industry practices. Her work continues to make a positive impact in the food industry ecosystem.

Eileen Torpy

Eileen Torpy oversees [Pilot Light's](#) external partnerships related to teacher professional development including AgEd (Agriculture Education) & Advocacy, Classroom to Cafeteria, and [SnackTime Explorers](#). She is passionate about supporting educators as they teach through food and expanding access to Food Education to more classrooms nationwide!

About Pilot Light

Pilot Light is a teacher-centered Food Education nonprofit that develops programming and educator capacity for the food system leaders of the future through engaging and relevant classroom learning.

Learn more and get involved at www.pilotlightchefs.org, and follow @pilotlightchefs on Instagram, Facebook, and LinkedIn.

Session 1

Food Education & Food Science 101

Objective

At the conclusion of this session, you will have a foundational understanding of :

- What food science is
- The different disciplines that make up the food science industry
- Pilot Light's Food Education Standards 1 - 3
- How food science impacts the principles of Food Education Standards 1 - 3

What is Food Science?

The Institute of Food Technologists defines food science as “The science of food encompasses food science, food technologies, and their applications across the food industry. Learn more about this exciting field and the positive impact in keeping our food safe, nutritious, delicious, and sustainable.”

What is Food Science? (cont'd)

Multidisciplinary industry

- Biology/Microbiology
- Chemistry
- Nutrition
- Physics
- Engineering
- Psychology

Applications of Food Science

Biology

Food preservation

Microbiology
Cheesemaking

Chemistry

Flavor & aroma
creation

Nutrition

Development of
nutraceutical foods

What are the Food Education Standards?

1. Food connects us to each other.
2. Foods have sources and origins.
3. Food and the environment are interconnected.
4. Food behaviors are influenced by external and internal factors.
5. Food impacts health.
6. We can make positive and informed food choices.
7. We can advocate for food choices and changes that impact ourselves, our communities, and our world.

Food Education Standards 1 - 3

1. Food connects us to each other.

2. Foods have sources and origins.

3. Food and the environment are interconnected.

Foods Connects us to Each other

By sharing food with others, we connect as humans and learn more about one another's experiences and identities.

Foods Have Sources and Origins

By honoring and acknowledging the land and people who grow and cultivate food, we can better understand the context and stories of cultures and trace their movements over time.

Foods and the Environment are Interconnected

By recognizing food (in all its forms) as a part of an ecosystem, we can analyze the interdependence of all living organisms on one another for energy and better address the effects humans have on the environment.

The Intersection of Food Science and Food Education Standards in the Classroom

FES 1: Foods Connects us to Each Other

Community Outreach: Elementary School Students worked together to assemble 322 "just add water" meals for seniors

- Used left over food from a food donation event (food *waste reduction* and *sustainability*)
- Ingredients were freeze dried to preserve them and make them shelf stable (*food processing, food chemistry, food microbiology*)
- Ingredients were measured into individual packets so they were all the same (*quality assurance*), and attached to a recipe card (*formulation*)

FES 1: Foods Connects us to Each Other

Buddy classroom model: Pre-K and 7th grade classes paired together to make butter

- Develop community through mentorship
- Taught perseverance and patience
- 7th graders continued with a separate lesson learning about viscosity and textures of foods (*food physics* and *food chemistry*)
- Pre-K continued with separate lesson on food preferences (*sensory science* and understanding of texture and functions of foods)

FES 2: Foods Have Sources and Origins

Subject Matter Expert/Professional Demonstrations

- Classroom visit by lavender farmer sharing about the uses of culinary lavender
- Students were allowed to experience the difference between culinary lavender and decorative lavender and discussed why they were similar and different (*aroma and flavor science*)
- Students tasted lavender in different applications: buttercream, tea, lemonade
- The students developed and sampled a lavender lemonade recipe (*formulation*)

FES 3: Foods and the Environment are Interconnected

Reflective exercises

- Discussed the idea of water being a limited resource,
- Reflected on trying not to be wasteful
- Brainstormed solution to be more conservative with water usage
- Students programmed an online software using logic codes and created quizzes about the importance of water in the diet and for the body as a whole (*nutrition, computer coding*)

Question List Question 1 of 19 | Total Points: 0 out of 10

Drinking Enough Water

Most of the body is made up of . In order for the body to function, we need to enough water. The recommended amount of water that we should drink each day is cups.

SUBMIT

In conclusion...

- The food science is a wide umbrella which is largely interdisciplinary and impacts the food system from its origins to its consumption.
- The Seven Food Education Standards (FES) look at the social and scientific factors of food, its accessibility, and its impacts on culture and wellbeing.
- Utilizing the FES to introduce concepts around food science is a synergistic approach to understanding the food ecosystem for learners

5-minute break – gather materials

Reminder to Change to Speaker View

Change your view to “Speaker” in the top right-hand corner where it says “View”

Session 2: Food Science Experiments

Session 2

Practical Application Lab *Astronomy: Out of this World Food*

Curriculum Objectives

Students will better understand the many implications of meal planning in space by collaborating small groups to learn about the categories of food that can be consumed during space travel, by creating a meal plan for an astronaut, and by creating recipes of foods that can be eaten in space.

Astronomy: Out of This World Food

Lesson Topics

- Anatomy
- Dehydration
- Hydration
- Outer space
- Nutrition

Integrated Subject(s)

- Science
- Mathematics
- English language arts

Materials – Equipment for Station 1

- Sink
- Cutting board
- Knife
- Convection oven or dehydrator (this lesson could be adapted with more time in advance if using a dehydrator!)
- Containers to store kale (raw and cooked) and fruit (raw and cooked)
- Sheet pan and parchment paper or foil
- Tasting plates, portion cups, and spoons for sampling
- Napkins and paper towels

Materials – Equipment for Station 2

- Sink
- Mixing bowl, tongs, and scale
- Measuring cups and spoons - 2 sets
- Plastic bags with closure for each student
- Tasting plates, portion cups, and spoons for sampling
- Napkins and paper towels

Materials - Ingredients

Station 1

- 4c dried fruit
- 3c fresh fruit

Station 2

- 2-4 instant pudding boxes (4 servings/box)
- 3 c dried milk
- Water

Station 1

Activity:

Dehydrating

@ Oven/Dehydrator- observe/discuss slow dehydration process & taste

1. Taste dried fruit (students will try and compare with raw and/or kale)
2. Purchase pre-dried bananas, strawberries, or pineapple (you choose!)
3. Heat oven at the lowest setting with a raw version of selected fruit (bananas, strawberries, or pineapple)

Note: This will take 60ish mins, so be sure to start this process beforehand, if using dehydrator start the day before.

Station 2 Activity: Rehydrating

@ Table station - make instant pudding in plastic bags
observe/discuss rehydration process & taste

- Follow directions listed in [recipe](#)* -- can have groups of students working in groups to weigh and read labels
- Taste dry powder mix (before adding liquid ingredients)
- Assemble instant puddings (each student can make their own mini portion, or you could work in groups -- whatever is easier)!
- Taste rehydrated pudding (after kneading)

Take Home Activity – DIY Trail Mix

Students will be given a selection of dried fruits made during the class activities.

Each student will mix fruits of their choice to make 1 cup of dried fruit trail mix.

Each student will create packaging for the individual trail mix.

Take home and share trail mix with family

Possible Cross Curricular Activities & Connections

Discussion and research:
Why do we need to leave
Earth?

Build background: What
is the International Space
Station?

Watch video clips: One
Strange Rock, Episode
“Escape”; WALL-E (bone
loss, lack of exercise,
food in liquid form)

Planning exercise: create
a 5-day meal plan

Growing exercise: how
lettuce grows in space

Culminating Activity:
Astronaut Meal

Thank you! Questions?

Tamieka Hardy

Tamieka@pilotlightchefs.org

www.pilotlightchefs.org

Session 3: Food Science Careers and Next Steps

Linda Perucca

- 30+ years in the Food & Beverage Industry
- Director SciTech Patent Art; Mondelez, Kraft Foods, Schwan's, Board Member Chicagoland Food Science Foundation
- Global Intellectual Property Management, Product Development, Corporate Learning & Capability Development
- **Brands:** Kraft Mac and Cheese, Kraft Cheese, DiGiorno Pizza, Tombstone Pizza, Oscar Mayer Hot Dogs
- **Education:** B.S. Food Science Degree - Purdue University
- **Favorite Subject in High School:** Geometry and Science

[Linda Perucca/ LinkedIn](#)

Food Industry Careers

- **The food industry is very diverse.**
- **Truly from Farm to Fork – many steps in between**
- **Employs from GED to PhD**
- **Link to Research from Purdue – to fill Ag related positions**
 - **Shortage of graduates to fill jobs**

Food Technology is.....

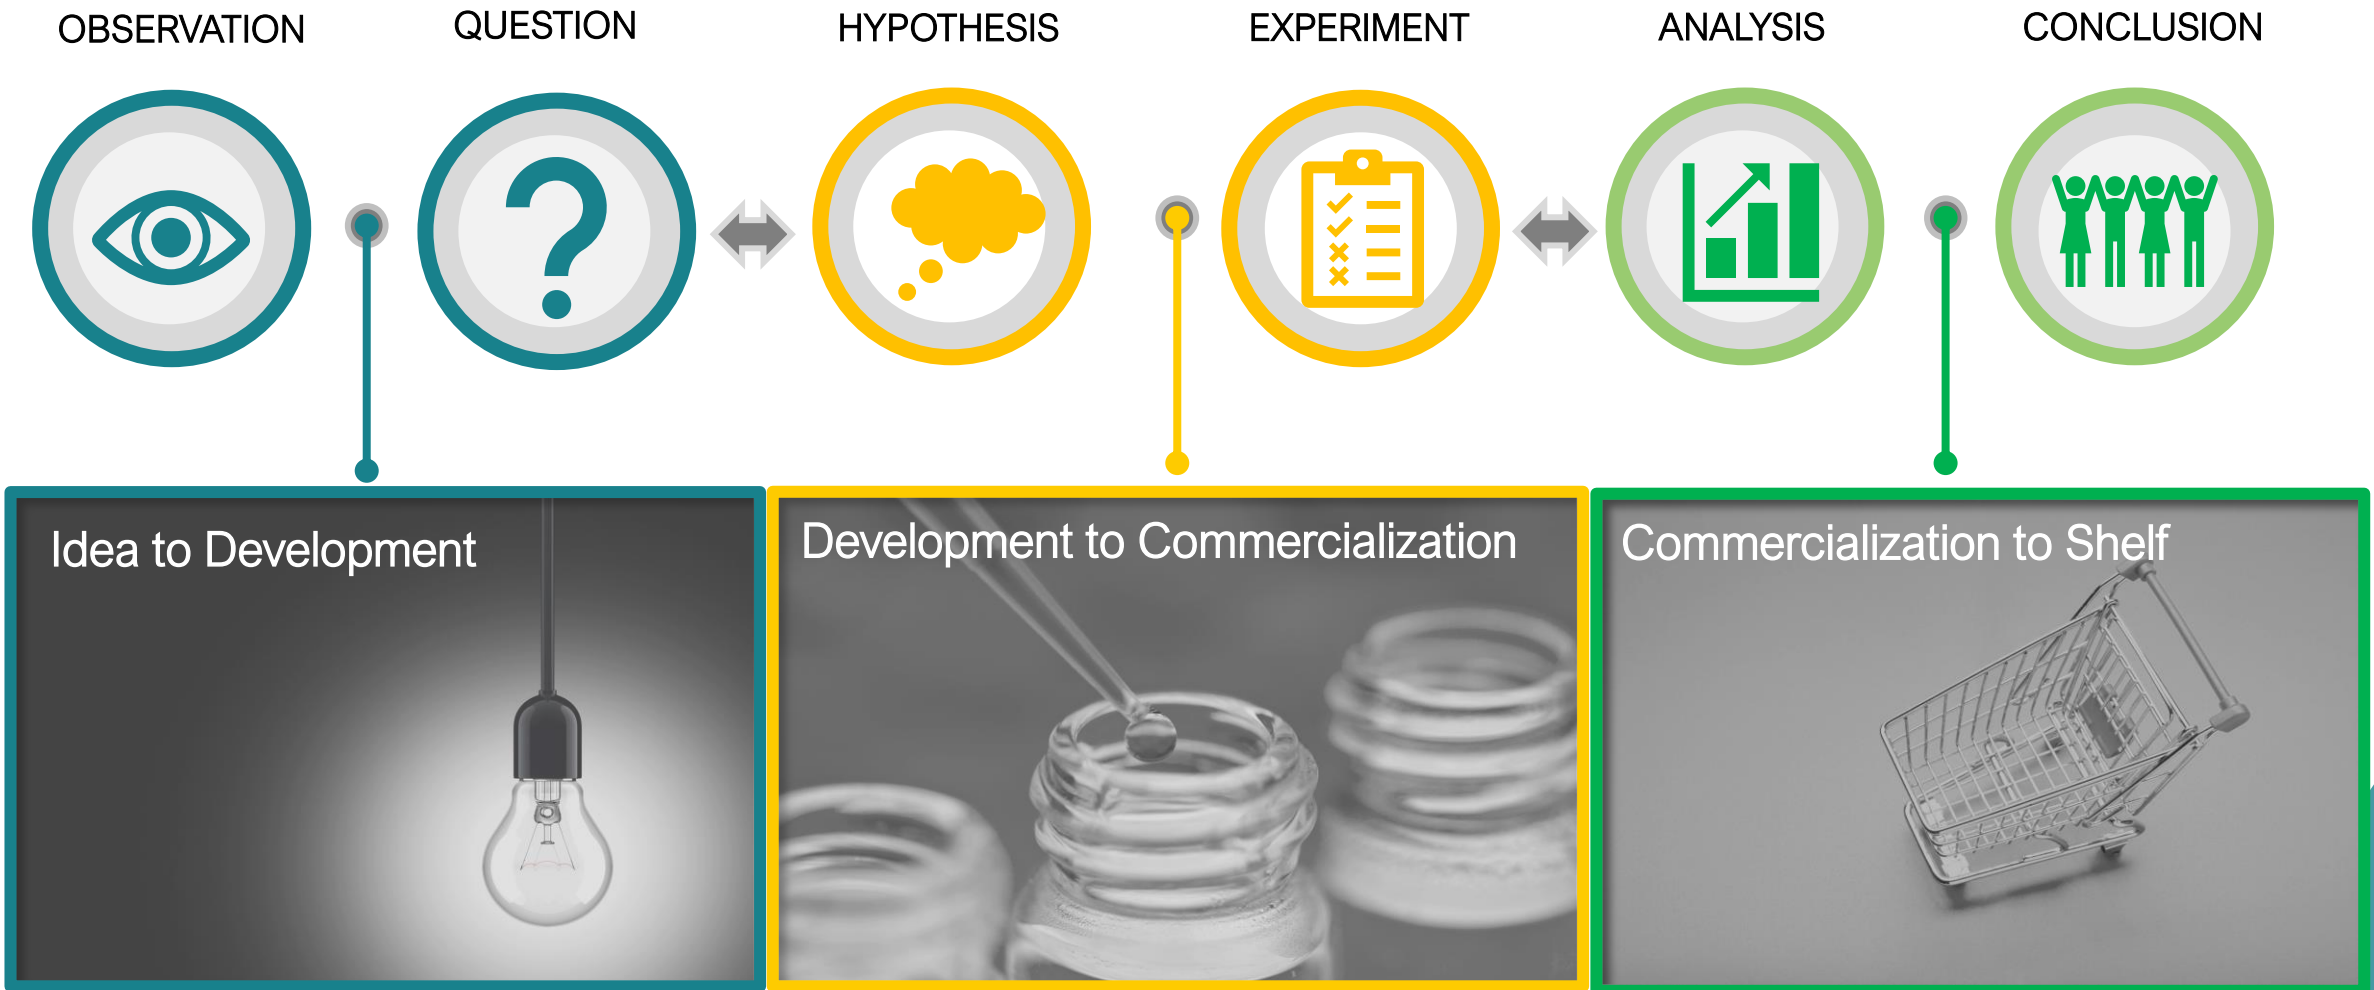

Food Technology is the **application** of food science principles and knowledge to the

- Selection
- Preservation
- Processing
- Packaging
- Distribution
- and Use of safe, nutritious & wholesome food.

From Concept to the Consumer. How ideas come to life.

The food industry applies the scientific method to the "Idea to Shelf" Innovation Stages. Different careers within these stages bring new products to the market.

Idea to Product Development

- Creating **new** products for the grocery store shelves is one of the most exciting projects in the industry.
- New product development requires strong communication skills, team-work, and project management skills!
- Everyone at the company is involved:
 - from understanding consumers wants and likes
 - to creating to new concepts with marketing & legal
 - to developing and testing the concepts with product development and sensory scientists
 - to purchasing equipment, ingredients, packaging
 - to making the product with engineering, manufacturing

PRODUCT DEVELOPMENT

Following these steps can help businesses successfully develop new products.

- ✓ **THINK ABOUT YOUR CUSTOMERS**
Evaluate any needs you believe your business may be able to solve for customers. Determine whether this will require a new product or an enhancement to an existing one.
- ✓ **CONSIDER YOUR IDEA'S FEASIBILITY**
Think about how commercially successful your new product or service may be. If it is too expensive to produce versus the revenue it will generate, it is not worth the effort.
- ✓ **DO YOUR RESEARCH**
Take a close look at the market and figure out whether there is a niche for your offering. If too many of your competitors are doing more or less the same thing, you will have an uphill climb.
- ✓ **LOOK INTO LEGAL RAMIFICATIONS**
Investigate whether or not your new product or service fits all appropriate regulations concerning your industry. Also, be sure you take the necessary steps to protect your intellectual property.
- ✓ **IDENTIFY THE VALUE YOUR IDEA WILL HAVE FOR YOUR CUSTOMERS**
When you have a clear concept of the appeal your new product will have, it will be much easier to market. This is a good opportunity to conduct some research to fine-tune the pitch you will make to consumers.
- ✓ **DETERMINE YOUR PRODUCT'S PRICING**
Now is the time to do the math when it comes to covering your production costs.
- ✓ **ASSEMBLE YOUR PROJECT TEAM**
The people who will execute your vision are as important as the original idea. Make sure you commit the best resources to your product development process and give your team what it needs to succeed.
- ✓ **PROTOTYPE YOUR PRODUCT**
A well-organized prototype stage gives you the chance to iron any wrinkles in the product's functionality as well as your marketing efforts.
- ✓ **PREP FOR LAUNCH**
Before putting your new product or service on the market officially, make sure you perfect your marketing strategy. It should look to the long-term as well as the launch window.

If you were creating a new chip, what would you create?

- What health or regulatory claims would you like to make?
 - Claims around salt, fat, protein, fiber, etc.
 - Claims including organic, ingredients, sourced from, and many more.
- What would the base of the chip be?
 - Corn, potato, vegetable powder, insects, get creative!
- Chip shape, packaging, colors, look and feel.
- Plain or with flavor varieties?

Key roles necessary for innovation and new product development

Consumer Insights (CI)

Understand the current market landscape, looking at data, trends, consumption info & consumer wishes. The goal is to help identify areas where a brand can play or improve current portfolio.

This Photo by Unknown Author is licensed under CC BY-NC

Marketing

Create new product concepts-with R&D and CI. Ideation, creation of new concepts, logos, brands to help drive new product development.

Research & Development (R&D)

Gold Standards development. Use scientific knowledge to help make a new product. R&D understands commercialization restraints, consumer data and marketing to make best product for company.

Sensory Scientists

Set up testing protocol and run test with consumers to determine if they will like the new food, buy it and prefer the new product about to be launched on the market.

Patent Attorney

Confirms the new idea does not infringe on another patent, brand or trademark. Reviews partnership opportunities, contracts & agreements.

Key roles ensure that quality products are available to the consumer

Research & Development (R&D)

Creates product that meets consumer needs. Tests variations of formulation that provide the best product. Packaging testing done to determine what materials protect the product.

62

This Photo by Unknown Author is licensed under CC BY-NC

Marketing

Establishes market/region product roll-out plan, portfolio cannibalization, sales projections, and advertisement/communication strategy

This Photo by Unknown Author is licensed under CC BY-NC

Food Safety

Conducts storage testing in different environments followed by micro/food safety testing to ensure product will remain safe throughout distribution and consumer's pantry

Regulatory

Establishes the nutritional panel and ingredient statement along with confirming any claims on package meets county regulations

Consumer Testing

Confirms product meets the consumer expectations and they are likely to purchase the product.

Development to Commercialization

Research & Development (R&D)

- College – Food Science/Packaging

Want crispy chips – packaging is key!

A typical potato chip bag is made of multiple layers of polymer materials. Polyethylene (PE) and Polypropylene (PP) films are two common plastic materials that are used. PE offering excellent moisture resistance that prevents the chips from becoming stale or soggy, and PP offering heat resistance.

Experiment:

Two bags of potato chips

1 paper bag

Stapler

1. Take a bag of potato chips and open it. Place the potato chips in a lunch size paper bag and staple it closed.
2. Allow the chips in the bag to sit in open room for minimum of 5 days.
3. After 5 days, open the paper bag along with the un-opened bag of potato chips and have each student taste both potato

64 chips

Food Industry Careers – Packaging Development Hands on Experiment for Packaging Materials

What is happening?

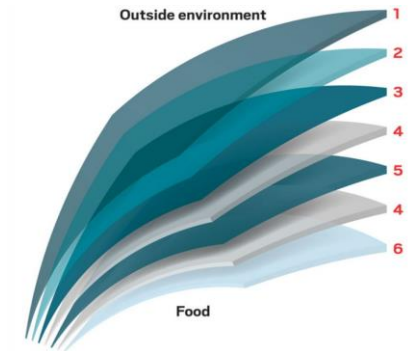

Potato chips go stale because they've gained too much moisture. That's because chips lose most of the moisture inside them during the frying process, creating a crunchy network of starch molecules.

- Potato chips have a moisture content of 1.5% - 3.5% while the typical home/school is around 40% - 50% humidity.
- Starch molecules are **hydrophilic**, meaning they attract water from the air around them. **Osmosis** refers to the movement of water molecules across a membrane trying to achieve equilibrium.
- The potato chips are gaining moisture in an attempt to reach equilibrium with the environment around them. The longer you leave them out the more moisture they will gain.

In order to keep potato chips fresh for as long as possible, manufacturers fill the bags with nitrogen gas. The nitrogen gas acts as a barrier between the chips and the outside air, preventing oxygen from getting in and causing **oxidation** of the fat in the potato chip.

1. Coating to protect print
2. Outer Layer printing surface
3. Structural layer for shape and prevents tearing and puncturing
4. Tie binds layer 3 and 5 together
5. Barrier prevents oxygen/moisture from infiltrating package
6. Seal packaging

Food Industry Careers – Packaging Development Hands on Experiment for Distribution Testing

Why is my bag of chips half full?

You've probably noticed that potato chip bags seem ½ full when you open them. But why? Nitrogen in your potato chip bag protects the potato chips by keeping the bag inflated around them making a cushion that prevents them from becoming crushed during distribution.

Experiment:

1. Take quart size bags and fill ½ way with potato chips.
2. Take a straw and insert into bag. As you blow into the bag, seal quickly so that the bag is full of air. (SEE PHOTO A)
3. Place in your "case" (you can use a small shipping box) and seal with tape. (SEE PHOTO B)
4. Drop the case from waist high 10 times.
5. Fill more quart zip lock bags ½ full with potato chips but remove as much air as possible. More bags will fit into your "case." (PHOTO C)
6. Drop this variable 10 times as well.
7. Open the cases up and **observe** the differences.

Food Industry Careers – Packaging Development Hands on Experiment for Distribution Testing

What happened:

Potato chip bags are usually only half full because they contain nitrogen to protect the chips from damage during handling, transportation, and storage. Nitrogen is an **inert gas** that will not expand or contract, unlike oxygen. This prevents the potato chips bags from popping when exposed to different elevations and temperatures.

The nitrogen gas will also help keep potato chips fresh. This is because it acts as a barrier between the chips and oxygen. **Oil oxidation** is an undesirable series of chemical reactions involving oxygen that degrades the quality of an oil giving a rancid flavor.

Commercialization to Shelf – General Process Steps

Production

Distribution

Shelf Placement

Consumer enjoyment

- **Commercialization to Shelf** is likely the most critical step in any business process.
- A misstep in this part of the process reduces the sales and profit for any business, can negatively impact brand image and reduce customer and consumer confidence in any future endeavor.

Key roles ensure that quality products are available to the consumer

Quality Control

Validates product specifications are met for food safety, taste, appearance and aroma (sensory) and regulatory compliance before release for sale.

Warehouse

Provides proper storage, handling and inventory management of finished products for best shelf life and adherence to customer requirements.

Distribution

Enables product arrives at customer location, customer distribution or central distribution as needed, preserving product quality and shelf life.

Sales and Marketing

Confirms store execution and product placement. Monitors product sales and feedback from the customer/consumer.

Commercialization to Shelf - (Typical) Role qualification and descriptions

Sensory Evaluation is one scientific method to determine if product quality meets standards.

HANDS ON EXPERIMENT – QUALITY CONTROL OF CHIPS

What you will demonstrate:

- How to use your senses to evaluate quality
- Identify sources of quality issues

SUPPLIES (FOR ONE SET)

- Sensory Evaluation Worksheet
- Lunch –size Paper Bags
- Pen or marker without odor
- 4 pieces of white paper
- 1 bag Baked Lays Salted Potato Chips
- Black Pepper or BBQ Seasoning
- Toaster Oven

Sample Prep For Sensory Evaluation Experiment

INSTRUCTIONS:

- 1). Divide contents of one bag of Baked Lays potato chips into 4 equal parts.
- 2). On separate paper bags, write on the outside "Control", "Sample 171", "Sample 245", "Sample 309"
- 3). Place equal parts of Baked Lays potato chips into each bag
- 4). Follow the instructions in the table below on how to treat the chips in each bag. Once treated, chips should be placed back into original bags. Store samples in a cool dry place for no more than 48 hours before evaluation.
- 5). Fold over the top of the bags until evaluation time, using the sensory worksheet for evaluation

CONTROL	Sample 171	Sample 245	Sample 309
Place chips from commercial bag directly into labeled paper bag.	1. Preheat oven to 350°F	1. Measure ½-1 teaspoon of black pepper (or BBQ seasoning)	Place chips from commercial bag directly into labeled paper bag.
	2. Place chips onto baking sheet	2. Place seasoning into sample bag containing chips	
	3. Heat for 3-5 minutes	3. Toss chips around lightly for seasoning to coat chips	
			

How to evaluate samples using your senses

INSTRUCTIONS: Each sample in the paper bag should be evaluated against samples in the bag labeled 'CONTROL'. Each evaluator can pour out half of the chips onto white pieces of paper identified with the sample code. Keep some of the chips inside the paper bag to evaluate for flavor. Use your 5 senses (sight, smell, taste, hearing, touch) to evaluate samples. Indicate the level of difference (0-3) for each sample compared to the Control

APPEARANCE: Appearance is typically the first sensory attribute evaluated. You use your **sense of sight** to evaluate the samples. Compare samples to the Control for differences in color, size (whole vs broken pieces), chip surface appearance.

FLAVOR: Flavor can be evaluated in two ways, both through the **sense of smell through your nose** or taste in the mouth. Open the paper bag with 'Control' on it, take a deep sniff and note the aroma. Take the Sample bag and repeat, noting any difference from the Control. Reset your sense of smell by smelling the inside of your elbow between the Control and Sample bags.

TEXTURE: Texture can be evaluated through the **sense of taste** or **sound + touch**. Take the control sample chip and break in half, listen to any sounds as the chip breaks. Touch the surface of the chip to notice any residue on the chip. Do the same with the sample chip and note any differences.

SENSORY EVALUATION Worksheet

Evaluator Name: _____

Instructions: Using the 4-point scale below, evaluate the level of difference the sample is from the control

RATING SCALE	0 Same	1 Slightly Different	2 Moderately Different	3 Extremely Different
---------------------	------------------	--------------------------------	----------------------------------	---------------------------------

Score appearance, flavor and texture using the rating scale (0-3) above compared to a CONTROL Sample

	Sample # 171	Sample # 245	Sample # 309	Notes
APPEARANCE				
FLAVOR				
TEXTURE				

SENSORY EVALUATION Summary

INSTRUCTIONS: 1. Collect worksheet scores. 2. Calculate the average score for **each sample** (sum divided by #evaluators or worksheets). 3. Discuss differences and cause for the differences as a group.

Evaluator Name	Sample #	Appearance	Flavor	Texture
	171			
AVE				

Evaluator Name	Sample #	Appearance	Flavor	Texture
	245			
AVE				

Evaluator Name	Sample #	Appearance	Flavor	Texture
	309			
AVE				

Sensory Evaluation Discussion Guide

1. Share the average score of each sample for appearance, flavor and texture see answer table below)

Score appearance, flavor and texture using the rating scale (0-3) above compared to a CONTROL Sample			
	Sample #171	Sample #245	Sample #309
APPEARANCE	2 - 3	3	0
FLAVOR	2 - 3	3	0

2. Discuss what issues in production could have caused the differences in the samples.

- **Sample #171:** Oven temperature too high in baking process and/or Time in Oven too long.
- **Sample #245:** Contamination with another seasoned product during production. Contamination could result if a). Filling line was not cleaned properly between production batches, b). Seasoning accidentally added to the batch during production.
- **Sample #309:** Control sample. No issues. *In every evaluation, there is typically a 'blind' control (sample added to calibrate evaluators, not known to evaluators).

ACTIONS taken after evaluation: Samples #171 and #245 would not pass Quality Control evaluation and would be held from shipping to customers. The Production team would determine preventive action to ensure these issues would not happen again.

Sensory Evaluation Q & A (additional questions used for discussion)

Q: Why is sensory evaluation used in the quality control process?

A: Typically, sensory evaluation is the final check before a product is released for distribution and sale. Sensory evaluation will follow other chemical and microbiological analysis to assess if product standards have been met through the entire production process. For food production, sensory evaluation is critical as products are sold for consumption. The sample may pass other prior analysis but may not pass sensory analysis. For example, sample #1 may be in the acceptable range for chemical tests such as moisture content or salt content but would clearly not be an acceptable sample based on other sensory parameters.

Q: Why are samples given codes (ie #171, #245, #309)?

A: Samples are given random 3-digit numerical codes to help eliminate bias in the evaluation process. Bias in the evaluation process may produce false positives or false negatives if the code is perceived as 'hints' for the samples. Best practice dictates that 3-digit codes such as '911', '411', area codes are not used because there is meaning attached to these numbers and could cause bias.

Q: Why are we using a 4-point scale?

A: There are many types of scales used in sensory evaluation depending on the objective of the experiment. In this case, we are using a typical degree of DIFFERENCE scale that is used to determine quality. The number of points on a scale help to differentiate between samples while making it relatively simple for everyone to use. You could have more points to differentiate but you should balance the simplicity and differentiation for the user.

Q: Why do we use average scores vs single evaluator scores to determine if the product passes quality assessment?

A: Average scores help to minimize any unintended differences NOT due to the chips themselves. This is often called 'noise'. Sources of noise include: physiological sensitivity differences between evaluators, carry-over effects from one sample to another, other bias uncontrolled by the experiment.

Q: What are some things that could happen if these chips that did not meet quality standards were sold?

A: If samples were shipped to customers, repercussions include: 1). Damage to trademark/brand, 2). Food safety issue (if someone was allergic to undeclared BBQ seasoning ingredients), 3). Recall due to undeclared ingredient in BBQ seasoning (food regulations/labeling).

Job Outlook (2020-2025)

With a **2.6% annual growth rate**, a research study out of Purdue University looked at job opportunities in Food, Agriculture, Renewable Natural Resources and the Environment (FARNRE).

59,400 jobs available annually in food.

Food industry employs about 10% of adults in US, 14.5 million people.

The Complete Cookbook for Young Scientists – Good Science makes Great Food, by America's Test Kitchen

Gluten is a network of proteins found in many baked goods. Wheat flour contains two kinds of protein, called glutenin ("GLUE-teh-nin") and gliadin ("GLY-a-din"). They are both coiled up pretty tightly—and in dry flour, they stay apart from each other. But when flour is mixed with water, these proteins unfurl and begin to link up. With time, kneading, or mixing, those linked proteins, now called gluten, form a network, kind of like a spiderweb. That network gets stronger with more time, kneading, or mixing, giving baked goods structure and support.

Soft, crumbly, or flaky baked goods such as muffins or Crepes (page 24) don't need a lot of gluten—so we mix batter until it's "just combined." Breads, on the other hand, often need a lot of gluten. We knead our Cinnamon Swirl Bread (page 26) for 8 minutes!

experiment

TAKING DOUGH DOWN THE HOME STRETCH

What is gluten, and how does it work? Find out in this flour-powered activity. You'll make one dough with a lot of gluten and one dough with none and then STREEEEETCH them out.

LET'S GO!

- Use masking tape and marker to label 1 small bowl "Wheat Flour" and second small bowl "Rice Flour."
- In bowl labeled "Wheat Flour," use spoon to stir together all-purpose flour and 5 teaspoons water until shaggy dough forms, about 1 minute.
- Sprinkle counter with extra all-purpose flour. Transfer dough to counter. Use your hands to gather dough into loose ball and knead dough (see page 28) until smooth, 3 to 4 minutes. Shape dough ball and wrap with plastic wrap. Return wrapped dough to bowl labeled "Wheat Flour."
- Repeat steps 2 and 3 with rice flour and water in bowl labeled "Rice Flour." Let both doughs rest for 10 minutes.
- MAKE A PREDICTION** Do you think the wheat flour dough and the rice flour dough will be the same or differently when you try to pull them apart? Why?

TOTAL TIME: 40 minutes
LEVEL:

MATERIALS

- Masking tape
- Marker
- 2 small bowls
- 2 spoons
- 1/4 cup (1 1/2 ounces) all-purpose flour, plus extra for counter
- 1-teaspoon measuring spoon
- Water
- Plastic wrap
- 1/4 cup (1 1/2 ounces) white rice flour, plus extra for counter

This process of molecules joining and releasing water is reversible. *Hydrolysis* occurs when a large molecule, such as sugar, is divided into smaller parts by adding water. If you hydrolyze a molecule of sucrose, you will get one molecule of fructose and one molecule of glucose. The body uses this hydrolysis process to digest the disaccharides in food. For hydrolysis to occur, water must be present. This is why sweetened drinks are not as thirst quenching as plain water. Part of the water is used to digest the sugar and is not available for other functions.

Three conditions can trigger hydrolysis. One condition is the presence of an enzyme to set off the reaction. A second condition is the addition of an acid. A third condition is the

Lactose-free milk is produced by adding an enzyme to hydrolyze the sugar. Each type of sugar requires a different enzyme for hydrolysis to occur. You can determine the names of the enzymes by simply changing the -ose ending of the sugar to -ase. For instance, sucrose hydrolyzes sucrose and lactose hydrolyzes lactose. Sucrase is also known as invertase. This is because the fructose and glucose mixture that results from the hydrolysis of sucrose is sometimes called *invert sugar*.

Alcohols
All organic compounds that contain at least one -OH group are called *alcohols*.

Nutrition News
Lactose Intolerance

Lactose is an enzyme that is present in the small intestine. Its presence is necessary for the digestion of milk sugar. Lactose intolerance is an inherited inability to produce the lactase enzyme necessary to properly digest lactose or milk sugar. Most Asian, Native American, and African American adults experience this problem to some degree.

Symptoms of lactose intolerance include a sour aftertaste when drinking milk, gas, bloating, nausea, diarrhea, and flulike stomach cramps followed by constipation are other symptoms.

People can buy lactase from most pharmacies in either pill or liquid form. Experimentation with dosages will help people determine how much of the enzyme they need to avoid symptoms when consuming milk products. The liquid lactase is usually added to milk and allowed to sit before drinking. The lactase will cause the milk to have a sweeter flavor. This is because the

lactose has been broken down into glucose and galactose. Dairy producers have developed a variety of lactose-free and lactose-reduced products. Examine the labels in the dairy case. Many stores stock milk that has 70% to 100% of the lactose removed. Some gourmet ice cream manufacturers are also making lactose-reduced ice creams.

Lactase is produced by *Lactobacillus acidophilus* bacteria, which normally live in the intestines. Antibiotics will kill these helpful bacteria as well as the bacteria that cause infections. Therefore, milk will sometimes be difficult to digest for several weeks after taking antibiotics. You can take care of this problem by eating a serving of yogurt shortly after finishing your antibiotic prescription. Be sure to choose yogurt that contains an active culture of *Lactobacillus acidophilus*.

Names of alcohols end in -ol. Examples include ethanol (ethyl alcohol), methanol (wood alcohol), and isopropanol (rubbing alcohol). All these alcohols are toxic if consumed in excess. Ethanol is the alcohol in alcoholic beverages. It can be made from any

blindness, or death. Methanol is produced by burning wood without oxygen present. Isopropanol is derived from petroleum and is not safe to consume.

There are several commonly used additives that are "sweet" alcohols. These alcohols are glycerol, mannitol, sorbitol, and xylitol. One source of glycerol is animal fats. See 8-5.

Lactose-reduced dairy products can be digested easily by people who experience lactose intolerance.

Cooking for Geeks: Real Science, Great Cooks, and Good Food. By, Jeff Potter

Overview from Amazon:

Why do we cook the way we do? Are you the innovative type, used to expressing your creativity instead of just following recipes? Do you want to learn to be a better cook or curious about the science behind what happens to food as it cooks? More than just a cookbook, *Cooking for Geeks* applies your curiosity to discovery, inspiration, and invention in the kitchen. Why do we bake some things at 350°F/175°C and others at 375°F/190°C? Why is medium-rare steak so popular? And just how quickly does a pizza cook if we overclock an oven to 1,000 F/540 C? Author and cooking geek Jeff Potter provides the answers to these questions and more, and offers his unique take on recipes -- from the sweet (a patent-violating chocolate chip cookie) to the savory (slow-cooked brisket). This book is an excellent and intriguing resource for anyone who enjoys cooking or wants to experiment in the kitchen.

Abstract: We describe a presentation on the science of pizza, which is designed for the general public including children ages 6 and older. The presentation focuses on the science of making and digesting cheese and bread. We highlight 4 major scientific themes: (1) how macromolecules such as carbohydrates and proteins are composed of atoms and small molecules; (2) how macromolecules interact to form networks in bread and cheese; (3) how microbes contribute to the texture of bread; and (4) how enzymes break down macromolecules during digestion. Using live demonstrations and interactive exercises with children in the audience, we provide simple explanations of the scientific principles related to these themes that are essential for understanding how to make pizza, and what happens when we eat it. This

Everyone loves PIZZA!!
Multidisciplinary lesson on the science of pizza.

Pizza science: interactive activities . . .

Table 3—Mapping lecture components to National Science Education Standards.

Science content standard	Lecture activity	Grades K to 4 teachers can:	Grades 5 to 8 teachers can:	Grades 9 to 12 teachers can:
A: Understanding scientific inquiry	Observe the appearance, taste, and texture of pizza, bread, and cheese.	Ask students to make observations about the texture of cheese and bread and formulate questions about their observations: Why does bread have holes? Why is some cheese soft and other cheese hard? How are bread and cheese made?	Ask students to make observations about the texture of cheese and bread and formulate questions about their observations: Why does bread have holes? Why is some cheese soft and other cheese hard? How are bread and cheese made?	Ask students to make observations about the texture of cheese and bread and formulate questions about their observations: Why does bread have holes? Why is some cheese soft and other cheese hard? How are bread and cheese made? What are the molecular origins of these properties?
B: Physical science standards	Discuss how the properties of materials depend on chemical composition motivated by the question "Why is milk liquid and cheese solid?"	Observe that milk is liquid and cheese is solid; properties of materials.	Observe the shape, color, and texture of milk versus cheese; milk is liquid and cheese is solid; properties and changes of properties in matter.	Observe the shape, color, and texture of milk versus cheese; molecular mechanism of forming a gel (cheese) from a liquid; structure and properties of matter.
E: Science and technology	Discuss technologies that have been developed to process milk and flour into cheese and bread.	Distinguish between natural and synthetic materials; the cheese we eat is made from milk.	Discuss technological design and innovations for production of bread and cheese.	Discuss technological design and innovations for production of bread and cheese.
G: History and nature of science	Profile food scientists, explore	Discuss science as a human endeavor; history of science.	Discuss science as a human endeavor; history of science.	Discuss science as a human endeavor; history of science.

Science & Our Food Supply – FDA

Food Safety & Food Nutrition Lessons for Middle & High School

Nutrition

Science and Our Food Supply: Using the Nutrition Facts Label to Make Healthy Food Choices (2017 Edition)

When it comes to making science, consumer sciences, and health relevant for your students, what better way than to apply it to something that's part of their everyday lives? Food gives you an ideal springboard for introducing the science that is at the heart of nutrition and exploring the impact that daily food and beverage choices can have on overall health.

This nutrition-based curriculum introduces students to the fundamentals of healthy food choices, using the Nutrition Facts label as the starting point, and may be used separately or in conjunction with the food safety curriculum. With engaging hands-on activities, students will become aware of calories, serving size, and the nutrients to get “more of” and “less of.” Designed for use by middle level and high school teachers, the emphasis is on an inquiry approach that is customizable to science, health, and/or family and consumer science classes, aligning with current education standards in these curriculum areas.

Your students will learn about:

- Using the Nutrition Facts Label
- Serving Size and Calories
- Sugar in Beverages
- Sodium in Snack Foods
- Meal Planning
- Healthy Eating Away from Home

[Nutrition Middle Level Guide \(PDF 5MB\)](#)

[Nutrition High School Guide \(PDF 5MB\)](#)

Food Safety

Science and Our Food Supply: Investigating Food Safety from Farm to Table (2014 Edition)

FDA in collaboration with the *National Science Teachers Association (NSTA)* have created *Science and Our Food Supply: Investigating Food Safety from Farm to Table*, an innovative, interactive supplementary curriculum for use in middle level and high school science classes. An advisory board of experienced teachers just like you developed and tested the materials.

Food safety has become an important national focus. Each year, approximately one sixth of the U. S. population has mild to severe illnesses caused by pathogens in food — and more than 3,000 people die from them. Learning food safety science will enable your students to better understand decisions and practices that may affect their personal health. It will encourage them to step up to the plate and take an active role in preventing foodborne illness.

This curriculum is linked to current education standards.

In each guide you'll find in-depth activities and labs covering this broad range of topics:

- Bacteria, including Foodborne Pathogens
- Proper food storage and handling
- Pasteurization Technology
- The Science of Cooking a Hamburger
- DNA Fingerprinting
- Outbreak Analysis

The FDA will send a packet of information with activities included **-FREE!**

Resource: FDA resource – Food Additives

<https://www.fda.gov/Food/IngredientsPackagingLabeling/ucm115326.htm>

The screenshot shows the FDA website's 'Everything Added to Food in the United States (EAFUS)' page. The header includes the FDA logo, navigation links (Home, Food, Drugs, etc.), and a search bar. The main content area features a title 'Everything Added to Food in the United States (EAFUS)' with a date of 'November 2011'. Below the title is a paragraph explaining that the information is generated from a database maintained by the U.S. Food and Drug Administration for Food Safety and Applied Nutrition (CFSAN) under an ongoing program known as the Prior Assessment of Food Additives (PAFA). It states that PAFA contains administrative, chemical, and toxicology data for over 2000 substances directly added to food. The EAFUS list contains ingredients added directly to food that FDA has either approved or listed as GRAS. A sidebar on the left contains a menu with categories like 'Ingredients, Packaging & Labeling', 'Allergens', 'Food Additives & Ingredients', etc.

Ingredients & Packaging	
Ingredients & Packaging Definitions	
Allergens	▼
Food Additives & Ingredients	▼
Generally Recognized as Safe (GRAS)	▼
Packaging & Food Contact Substances (FCS)	▼
Irradiated Food & Packaging	▼
Environmental Decisions	▼
Food from Genetically Engineered Plants	▼

Types of Ingredients	What They Do	Examples of Uses	Names Found on Product Labels
Emulsifiers	Allow smooth mixing of ingredients, prevent separation Keep emulsified products stable, reduce stickiness, control crystallization, keep ingredients dispersed, and to help products dissolve more easily	Salad dressings, peanut butter, chocolate, margarine, frozen desserts	Soy lecithin, mono- and diglycerides, egg yolks, polysorbates, sorbitan monostearate
Stabilizers and Thickeners, Binders, Texturizers	Produce uniform texture, improve "mouth-feel"	Frozen desserts, dairy products, cakes, pudding and gelatin mixes, dressings, jams and jellies, sauces	Gelatin, pectin, guar gum, carrageenan, xanthan gum, whey
pH Control Agents and acidulants	Control acidity and alkalinity, prevent spoilage	Beverages, frozen desserts, chocolate, low acid canned foods, baking powder	Lactic acid, citric acid, ammonium hydroxide, sodium carbonate
Leavening Agents	Promote rising of baked goods	Breads and other baked goods	Baking soda, monocalcium phosphate, calcium carbonate
Anti-caking agents	Keep powdered foods free-flowing, prevent moisture absorption	Salt, baking powder, confectioner's sugar	Calcium silicate, iron ammonium citrate, silicon dioxide
Humectants	Retain moisture	Shredded coconut, marshmallows, soft candies, confections	Glycerin, sorbitol
Yeast Nutrients	Promote growth of yeast	Breads and other baked goods	Calcium sulfate, ammonium phosphate
Dough Strengtheners and Conditioners	Produce more stable dough	Breads and other baked goods	Ammonium sulfate, azodicarbonamide, L-cysteine
Firming Agents	Maintain crispness and firmness	Processed fruits and vegetables	Calcium chloride, calcium lactate
Enzyme Preparations	Modify proteins, polysaccharides and fats	Cheese, dairy products, meat	Enzymes, lactase, papain, rennet, chymosin
Gases	Serve as propellant, aerate, or create carbonation	Oil cooking spray, whipped cream, carbonated beverages	Carbon dioxide, nitrous oxide

Applications of Disciplines Involved in Food Science and Technology

Discipline	Examples of Food Science and Technology Applications
Biology, Cell Biology	Understanding of postharvest plant physiology, food quality, plant disease control, and microbial physiology; food safety
Biotechnology	Rice with increased content of beta-carotene (vitamin A precursor); enzymes for cheesemaking, breadmaking, and fruit juice manufacture
Chemistry	Food analysis, essential for implementing many of the applications listed here; improved food quality; extended shelf life; development of functional foods (foods and food components providing health benefits beyond basic nutrition)
Computer Science Genomics	Food manufacturing process control, data analysis Understanding of plant and animal characteristics; improved control of desirable attributes; rapid detection and identification of pathogens
Materials Science	Effective packaging; understanding of how materials properties of foods provide structure for texture, flavor, and nutrient release
Microbiology	Understanding of the nature of bacteria (beneficial, spoilage, and disease-causing microorganisms), parasites, fungi, and viruses, and developments and advances in their detection, identification, quantification, and control (for example, safe thermal processes for commercial sterilization); hygiene; food safety
Nutrition	Foods fortified with vitamins and minerals for health maintenance; functional foods for addressing specific health needs of certain subpopulations; development of diets that match human nutrient requirements; enhanced health and wellness
Physics, Engineering	Efficient food manufacturing processes to preserve food attributes and ensure food safety; pollution control; environmental protection; waste reduction efforts
Sensory Science	Understanding of chemosenses (for example, taste and odor) to meet different flavor needs and preferences
Toxicology	Assessment of the safety of chemical and microbiological food components, food additives

Modernist Pantry

Kitchen Alchemy

<https://blog.modernistpantry.com/education/>

One of my favorite experiments is Molecular Gastronomy or Culinary Spherification - you can buy 'food grade' ingredients and watch the videos to create a cool lab for your students!

 <p>Sodium Alginate + Calcium Lactate Gluconate Value Pack \$14.99</p>	 <p>Sodium Alginate + Calcium Lactate Value Pack \$14.99</p>	 <p>Sodium Alginate + Calcium Chloride Value Pack \$14.99</p>
--------------------------------------------------------------------------------------------------------------------------------------------------------------	----------------------------------------------------------------------------------------------------------------------------------------------------	------------------------------------------------------------------------------------------------------------------------------------------------------

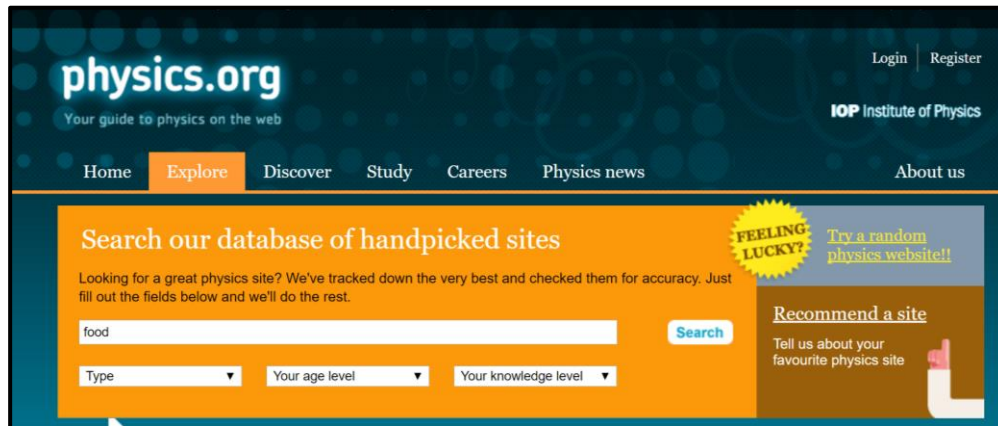

The screenshot shows the Kitchen Alchemy website interface. At the top, there is a navigation bar with links for Education, Recipes, WTF, Shop, and social media icons. The main content area is divided into several sections:

- Modernist Pantry Courses:** Features two course cards: "Spherification Course" and "Gummy Course".
- References:** A grid of reference sheets including "How To Acid Adjust Juices", "What is a dough conditioner?", "How to Blend Emulsifiers", "Modernist Ingredients: Volume to Weight Conversion Reference Sheet", "A Guide to Gums", "Gelatin Usage Chart", "Methylcellulose Usage Chart", and "The Confusion over Conversion".
- Ask A Chef:** A grid of articles including "How To Acid Adjust Juices", "What is a dough conditioner?", "How to Blend Emulsifiers", "Coating Gummies 3 Ways", "Modernist Ingredients: Volume to Weight Conversion Reference Sheet", "The Confusion over Conversion", "A Guide to Gums", and "Gelatin Usage Chart".

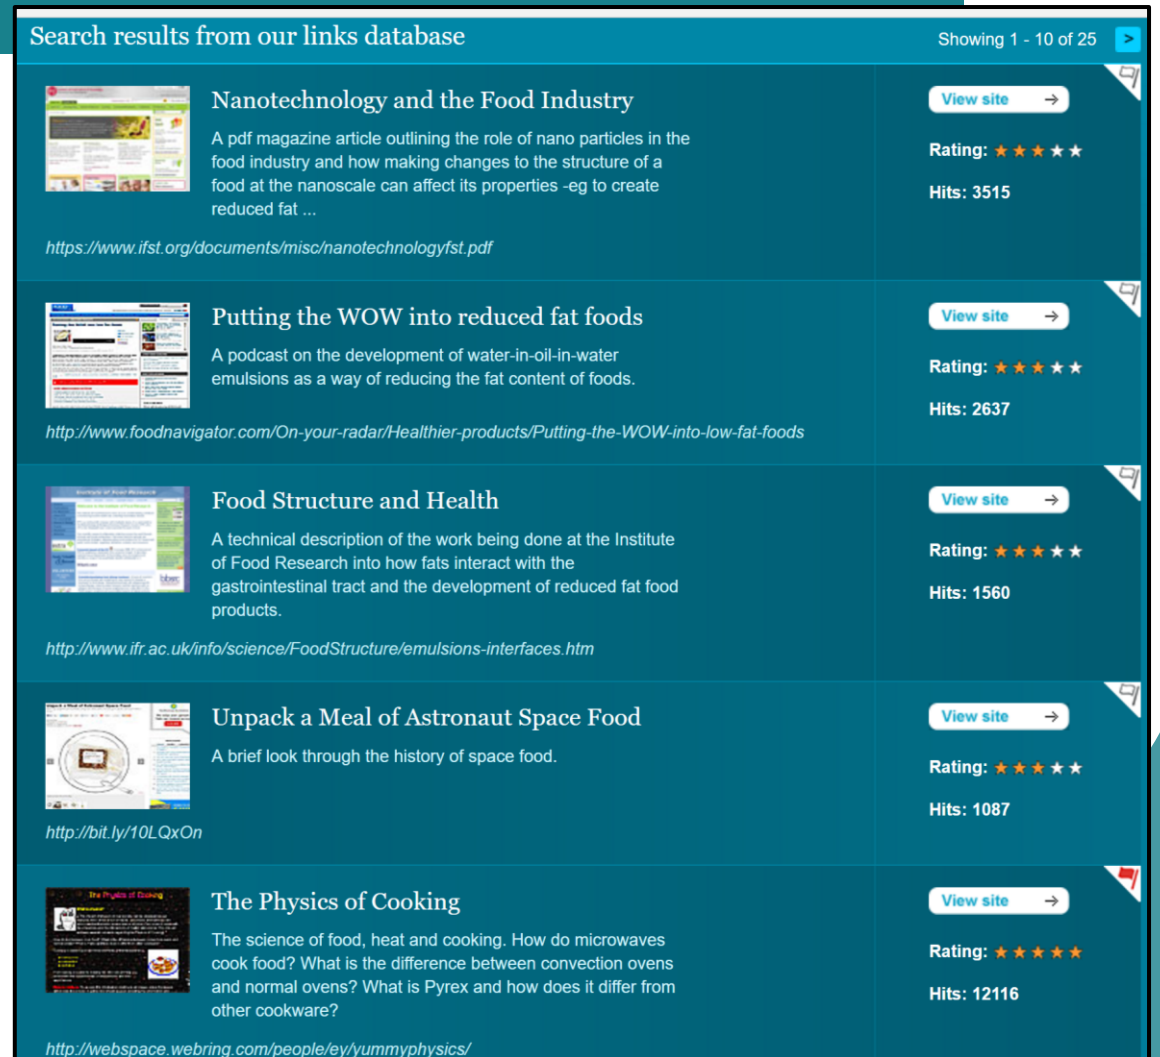

A "Load More" button is located at the bottom of the References section. A green arrow points from the text box above to the "Spherification Course" card.

Teach Physics with Food!

<http://www.physics.org/explore.asp>

The screenshot shows the physics.org website. At the top, it says "physics.org" and "Your guide to physics on the web". There are navigation links for Home, Explore, Discover, Study, Careers, Physics news, and About us. A search bar is prominently displayed with the text "Search our database of handpicked sites". Below the search bar, there are filters for "Type", "Your age level", and "Your knowledge level". A "Search" button is next to the search bar. To the right of the search bar, there is a "Recommend a site" section with the text "Tell us about your favourite physics site". A yellow starburst graphic says "FEELING LUCKY? Try a random physics website!".

The screenshot shows search results from the physics.org links database. The header says "Search results from our links database" and "Showing 1 - 10 of 25". There are five search results listed, each with a thumbnail image, a title, a description, a URL, a "View site" button, a rating (represented by stars), and the number of hits.

35%

FISH & SEAFOOD FOOD LOSSES

8% of fish caught globally is thrown back into the sea. In most cases they are dead, dying or badly damaged.

This is equal to almost 3 billion Atlantic salmon.

At the Monell Center, scientists from many disciplines work together to focus on understanding the mechanisms and functions of taste and smell and define the broad significance of these senses in human health and disease. Monell is the world's only independent, non-profit scientific institute dedicated to basic research on taste and smell.

HOW YOUR NOSE PROTECTS ITSELF

Research from the Tizzano lab increases understanding of a mysterious sensory cell that may protect vulnerable olfactory receptors.
[Learn more here.](#)

ANOSMIA

The *Identifying Treatments for Taste and Smell Disorders (ITTSD)* conference brought together scientists, physicians, and patients to learn from each other.

What is Food Science?

Food Scientists study...

Food Scientists understand

Let's experiment!

- **Let's experiment with flavor varieties and seasoning blends.**

- Who makes the flavors or seasonings?

Flavor Chemists are speciality chemists that create all the flavored products for every product around the world. They are trained by committing to a 7-year apprenticeship, where they study and work to learn about every seasoning and flavor ingredient used in food & beverages.

- **Flavor & seasonings are considered 'ingredients' in finished food and beverages.**

- When you look at the ingredient statements, there is a company behind each ingredient. Each company employs scientists, business professionals, engineering, and manufacturing professionals.

- **Developing flavors and seasonings is a fun job; having the opportunity to influence a finished product's success is very rewarding!**

- **Example of a company that sells flavors to food & beverage companies:**

Mixing up a taco seasoning

Flavors can be liquid or dry. In a lab setting, components are mixed to create new taste experiences, or to emulate something that is a desired flavor. Spices mixed together are also called seasonings, another form of a dried or powdered flavors. Flavors can be made with everyday kitchen spices, not just in a lab! In this lab, we will explore the world of flavors and create our own taco seasoning. It's easy to buy a taco seasoning at the store, but even better to make your own. You can personalize your seasoning based on your taste preferences!

Approximate Time needed for demonstration:

- 5 minutes

Ingredients you will need:

- 1 tablespoon chili powder
- 1 tablespoon salt
- 1 teaspoon garlic
- ½ teaspoon onion
- 1 teaspoon turmeric
- ¾ teaspoon cumin
- ¾ teaspoon cayenne
- ¾ teaspoon of oregano
- 1 tablespoon + 1.25 teaspoons flour

And 1 bag of chips (Potato chips or tortilla chips) to season

Or, the seasoning can be added to ground turkey/chicken/beef, sour cream or greek yogurt.

Equipment you will need:

1. Mixing bowl
2. Spoon
3. Microwave safe bowl (if you are seasoning chips)
4. Large zipper baggie (if you are seasoning chips)

Instructions:

1. Gather mixing bowl and spoon
2. Pour each ingredient into the bowl
3. Mix thoroughly together, so no spices are clumping together.
 - * We just made a taco seasoning. You can use this in many ways! You can season your cooked meat for tacos, add to sour cream or Greek yogurt for a southwest chip dip or use it to season chips. If you want to season chips, follow the instructions below.

Science demonstration provided by McCormick Flavor Solutions, 2024
<https://www.fona.com/learn/discover-fona-food-science-for-young-minds/>

Mixing up a seasoning

Instructions to season chips (if you so choose):

- To season chips, grab a microwave safe bowl.
- Put 1-2 hands full of chips into the bowl.
- Microwave chips for 30 seconds.
- Dump the warm chips into a zip lock baggie.
- Sprinkle on the seasoning into the bag & shake until the seasoning is coating the chips.

What's happening?

When we mix this seasoning together, it is very similar to what we do here in the lab every day, just with a slightly different set of ingredients.

Flavors rely on the sense of smell and taste (see [Experiment-How do you taste?](#) to see how aroma affects how something tastes).

Many of the chemicals that we use are for the smell part of taste. Without these, what we call volatiles, taste would be limited to only what our tongues can detect.

The tongue is limited to five different tastes called the basic taste.

The spices that we used in our lab today give off both a volatile perception and a basic taste response. Together, these are what cause the seasoning to taste like tacos.

If you chose to season potato chips or tortilla chips, when the chips were warmed in the microwave the oils are released from the chip and come to the surface. When the chips shake in the baggie with the seasoning, it allows the seasoning to adhere to the oils and stick to the chips.

Delicious!

Science demonstration provided by McCormick Flavor Solutions, 2024
<https://www.fona.com/learn/discover-fona-food-science-for-young-minds/>

Create a Seasoning (slide 3/3)

Using the instructions on previous slide, created a variation of chips. Change the seasoning, chip or snack base and create a whole new eating experience!

Buttermilk Ranch Seasoning

1. ½ cup Buttermilk Powder
2. 1T dried Parsley
3. 1T Garlic Powder
4. 1T Onion Powder
5. 2 t dried Dill
6. 1 t freeze dried Chives
7. ½ t black pepper

Barbecue Seasoning

1. ¾ + 1/8 teaspoon garlic powder
2. ½ + 1/8 teaspoon onion powder
3. 1 teaspoon salt
4. 1 teaspoon tomato powder
5. ½ + 1/8 teaspoon vinegar powder
6. ¾ + 1/8 teaspoon sugar
7. 1 + 1/4 teaspoon powdered BBQ sauce flavor
8. 1/8 teaspoon powdered hickory or beechwood smoke

Other experiments to demonstrate the science of food - as suggested in the chat by other educators

- Talk about yeast & fermentation in bread making.
- Herb lesson, create simple syrups with various herbs for various flavored iced teas.
- Egg unit - Egg as an emulsifier to make Mayo. Or investigate how heat & acids affect egg protein.
- Ice cream to investigate colligative properties on solutions.
- Pizza dough – from flour to elastic dough, gluten development, it forms a 'net' to catch carbon dioxide.
- AP Chem - Chemistry of food & baking
- Making cultures in biology class
- Milk to Yogurt
- Caramelization of sugar
- Make butter, all the various stages & phases cream goes through.

**Anything used for an experiment regarding food, ensure your ingredients are 'food grade' and 'safe for consumption.'*
